Giant Cell Tumor Symposium Part 2

We are back with the second part of the Giant Cell Tumor Symposium for Journal of Bone and Soft Tissue Tumors.

Two very important aspects are covered in this part. First is the histopathological concepts regarding GCT. There is lot of new knowledge that is available in recent years and that has significantly impacted the diagnosis, management and prognosis of GCT. Histopathological assessment play a major role in terms of determining the behaviour of GCT. Current understanding of molecular pathogenesis of GCTB particularly RANK on osteoclast-like GCs and RANKL on stromal cells and development of newer agents such as denosumab and INF- α has tremendously impacted management of patients with GCTB. This aspect is elaborated in the first article. The second article builds on these concepts and describes how this is used for adjuvant therapy for GCTB. Authors of both the authors have taken tremendous effort to make both these articles good and current. Also these two now conclude the GCT Symposium and cover all aspect of GCTB

Please write to us regarding your suggestions and opinions

Regards
